

The image shows a Siemens SIMATIC WinCC (TIA Portal) V13 control panel in an industrial environment. The panel is mounted on a stainless steel stand and features a large touchscreen display showing a process flow diagram. Below the screen are several physical buttons, including a prominent red emergency stop button. The background consists of complex industrial machinery with stainless steel pipes, valves, and cylindrical components. The overall scene is brightly lit, highlighting the metallic surfaces and the control interface.

Introduction

Life science industries are increasingly basing key decisions on regulated records that are often being generated, processed and kept electronically. Further than that reviews and approval of such data are also being provided electronically. Thus the appropriate management of electronic records and electronic signatures become an important topic for the life science industries.

Accordingly regulatory bodies defined criteria under which electronic records and electronic signatures will be considered being as reliable and as trustworthy as paper records and handwritten signatures executed on paper. These requirements have been set forth by the US FDA in 21 CFR Part 11¹ (in short: *Part 11*) and by the European Commission in Annex 11 to chapter 4 of the EU GMP Guideline² (in short: *Annex 11*).

Since requirements on electronic records and electronic signatures are always tied to a computerized system being in a validated state, both regulations also include stipulations on validation and life-cycle of the computerized system.

Application of *Part 11* and *Annex 11* (or their corresponding implementation in national legislation) is mandatory for the use of electronic records and electronic signatures. However, these regulations are only valid within their defined scope.

The scope of both regulations is defined by the regional market the finished pharmaceutical is distributed to, and by whether or not the computerized systems and electronic records are used as a part of GMP-regulated activities (see Part 11.1¹ and Annex 11 Principle²).

Supplemental to the regulations a number of guidance documents, good practice guides and interpretations have been published in recent years to support the implementation of the regulations. Some of them are being referred to within this document.

To help its clients, Siemens as supplier of SIMATIC WinCC (TIA Portal) evaluated version 13 of the system with regard to these requirements and published its results in this Compliance Response. Due to its level of detail, this analysis is based on the regulations and guidelines mentioned above.

SIMATIC WinCC (TIA Portal) V13 fully meets the functional requirements for the use of electronic records and electronic signatures.

Operation in conformity with the regulations is ensured in conjunction with organizational measures and procedural controls to be established by the client (the regulated company). Such guidelines are mentioned in section 3 of this document.

This document is divided into three parts: chapter 1 provides a brief description of the requirement clusters, while chapter 2 introduces the functionality of SIMATIC WinCC (TIA Portal) V13 as means to meet those requirements. Chapter 3 contains a detailed system assessment on the basis of the single requirements of the according regulations.

¹ 21 CFR Part 11 *Electronic Records; Electronic Signatures*, US FDA, March 20th 1997 (revised as of April 1st, 2013)

² *Volume 4 Good Manufacturing Practice Medicinal Products for Human and Veterinary Use / Annex 11: Computerised Systems*, European Commission / EudraLex, June 30th 2011

1 The Requirements in Short

Annex 11 and Part 11 take into account that the risk of manipulation, misinterpretation and changes without leaving a visible trace is higher with electronic records and electronic signatures, than with conventional paper records and handwritten signatures. Furthermore the means to restrict access to electronic records to authorized individuals are very different to those required to restrict access to paper records. Additional measures are required for such reasons.

The terms "electronic record" / "electronic document" mean any combination of text, graphics, data, audio, pictorial or other information representation in digital form, that is created, modified, maintained, archived, retrieved or distributed by a computer system.

The term "electronic signature" means a computer data compilation of any symbol or series of symbols executed, adopted, or authorized by an individual to be the legally binding equivalent of the individual's handwritten signature. Since electronic signatures are also considered being electronic records by themselves, all requirements on electronic records are applied to electronic signatures too.

The following table provides an overview of the requirements from both regulations.

Requirement	Description
Life Cycle and Validation of the Computerized System	<p>Computerized systems used as a part of GMP-related activities must be validated. The validation process should be defined using a risk-based approach. It should cover all relevant steps of the lifecycle and must provide appropriate documented evidence.</p> <p>The system's functionality should be traceable throughout the lifecycle by being documented in specifications or a system description.</p> <p>A formal change control procedure as well as an incident management should be established. Periodic evaluation should confirm that the validated state of the system is being maintained.</p>
Suppliers and Service Providers	<p>Since competency and reliability of suppliers and service providers are considered as key factors, the supplier assessment should be chosen using a risk-based approach. Formal agreements should exist between the regulated user and these 3rd parties, including clear responsibilities of the 3rd party.</p>
Data Integrity	<p>Under the requirements of both regulations electronic records and electronic signatures must be as reliable and trustworthy as paper records.</p> <p>The system must provide the ability to discern altered records. Built-in checks for the correct and secure handling of data should be provided for manually entered data as well as for data being electronically exchanged with other systems.</p> <p>The system's ability to generate accurate and complete copies is essential for the use of the electronic records for regulated purposes, as well as the accessibility, readability, and integrity of archived data throughout the retention period.</p>
Audit Trail, Change Control Support	<p>Besides recording changes to the system itself as mentioned above, both regulations require that changes on GMP-relevant data are being recorded.</p> <p>Such audit trail must include information on the change (before / after data), the identity of the operator, a time stamp, as well as the reason for the change.</p>

Requirement	Description
System Access, Identification Codes and Passwords	<p>Access to the system must be limited to authorized individuals. Attention should be paid to password security. Changes on the configuration of user access management should be recorded.</p> <p>Periodic reviews should ensure the validity of identification codes. Procedures should exist for recalling access rights if a person leaves and for loss management.</p> <p>Special consideration should be given to the use of devices that bear or generate identification code or password information.</p>
Electronic Signature	<p>Regulations consider electronic signatures being legally binding and generally equivalent to handwritten signatures executed on paper.</p> <p>Beyond requirements on identification codes and passwords as stated above, electronic signatures must be unique to an individual. They must be linked to their respective electronic record and not be copied or otherwise being altered.</p>
Open Systems	<p>Open systems might require additional controls to ensure data integrity and confidentiality.</p>

2 Meeting the Requirements with SIMATIC WinCC (TIA Portal)

The Siemens recommendations for the system architecture, conception, and configuration will assist system users in achieving compliance. For additional information and assistance see "GMP Engineering Manual SIMATIC WinCC (TIA Portal)" from the VSS Pharma.

The requirements explained in chapter 1 can be supported by the system as follows.

2.1 Life Cycle and Validation of Computerized Systems

Although *Annex 11* in 1992 and *Part 11* in 1997 underlined that a computerized systems should be subject to validation, it was not until the 2011 revision of *Annex 11*, that a comprehensive set of criteria for the validation of the system and its life-cycle had been introduced.

Nonetheless the requirements to validate a computerized system and to keep it in a validated state had long been a part of regulations other than *Part 11* and *Annex 11*. This was the motivation for the ISPE³ to publish practical guidance like the Baseline Guide⁴, the GAMP 5⁵ guide as well as the GAMP Good Practice Guides.

Thus the systems life-cycle as well as the approach to validation should be defined considering the guidance from the GAMP 5 guide. The guide also includes a number of appendices for life-cycle management, system development and operation of computerized systems.

Since most pharmaceutical companies already have a validation methodology for computerized systems as a part of their process landscape, it is preferable to setup the systems life-cycle and validation according to these.

2.2 Suppliers and Service Providers

Suppliers of systems, solutions and services must be evaluated accordingly, see GAMP 5 Appendix M2. SIEMENS as a manufacturer of SIMATIC hardware and software components follows internal procedures of Product Lifecycle Management and Quality Management System, which is regularly reviewed and certified by an external certification company.

⁴ Baseline® Pharmaceutical Engineering Guides for New and Renovated Facilities

⁵ GAMP 5 – A Risk-Based Approach to Compliant GxP Computerized Systems, ISPE, 2008

2.3 Data Integrity

Data integrity is assured in the system by measures like access security, audit trail, data type checks, checksums, backup/restore, and archiving/retrieval, completed by system validation, appropriate procedures and training for personnel.

Continuous archiving

Process data (messages, process values) and audit trails can be recorded and stored. They can also be transferred into long-term archives, secured by checksum for documented data integrity.

Log segments			
Parameter	Alarms and events	Fast data log	Slow data log
Time period of all segments	1 Week	1 Week	1 Week
Maximum size of all segments	1000 Megabyte	1000 Megabyte	1000 Megabyte
Time period contained in a single segment	1 Day	1 Day	1 Day
Maximum size of a segment	100 Megabyte	100 Megabyte	100 Megabyte
Time of first segment change	Wednesday , March ...	Wednesday , March ...	Wednesday , March ...
Backup	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Path	C:\Backup\Alarms	C:\Backup\Processval...	D:\Backup\Processval..
Backup to both paths	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Alternative path			
Signing enabled	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Cycle		1 min	
Compressed values with shorter or equal c		<input type="checkbox"/>	
Factor		1	
Cycle		1 min	

Figure 1: Configuration of archiving strategy for WinCC Runtime Professional V13

In case of local HMI panels, the data are buffered to a local storage device (e. g. CF card), and then transferred via the network or USB device.

Batch-oriented archiving

The WinCC premium add-on PM-QUALITY is used for batch-oriented data archiving. PM-QUALITY automatically manages the local and long-term archives. To enable access to WinCC data, PM-QUALITY deploys the standard interfaces of SIMATIC WinCC. These are also available to other archiving tools (Siemens or third-party manufacturers).

2.4 Audit Trail, Change Control Support

"Audit trails can be particularly appropriate when users are expected to create, modify, or delete regulated records during normal operation." In other words, an audit trail is required for manually entered data and/or automatically recorded data, which have been modified or deleted by an operator.

Audit trail during runtime operation

SIMATIC WinCC (TIA Portal) supports the requirement for audit trail of GMP relevant operations by recording such actions appropriately (who, what, when, and optionally why). And it provides adequate system security for such electronic records (e.g. access control). The GMP relevant data is defined by the regulated company based on the applicable regulatory requirements.

Process data (e.g. process values, process or operating messages) are stored in the system, without any option for the operator to change this data. No audit trail is required for these data.

WinCC Runtime Professional

Operator actions performed in WinCC can be recorded in an audit trail. The audit trail can be printed, exported, and archived.

Date	Time	Number	User	Alarm text	Tag	OldValue	NewValue	Comment	Computername
17/06/14	13:51:14.349	12508141	Boss	Safe_IO_Value: Boss new=240 old=234	Safe_IO_Val	234	240	X	VMWIN2008S

17/06/14	13:53:23.909	12508141	Boss	Pumpen_kw: Boss new=650 old=600	Pumpen_kw	600	650	X	VMWIN2008S

Figure 2: Display of the audit trail by means of Alarm Logging

Comfort Panels / WinCC Runtime Advanced

The relevant data to be tracked in the audit trail can be configured on the engineering system, see figure below.

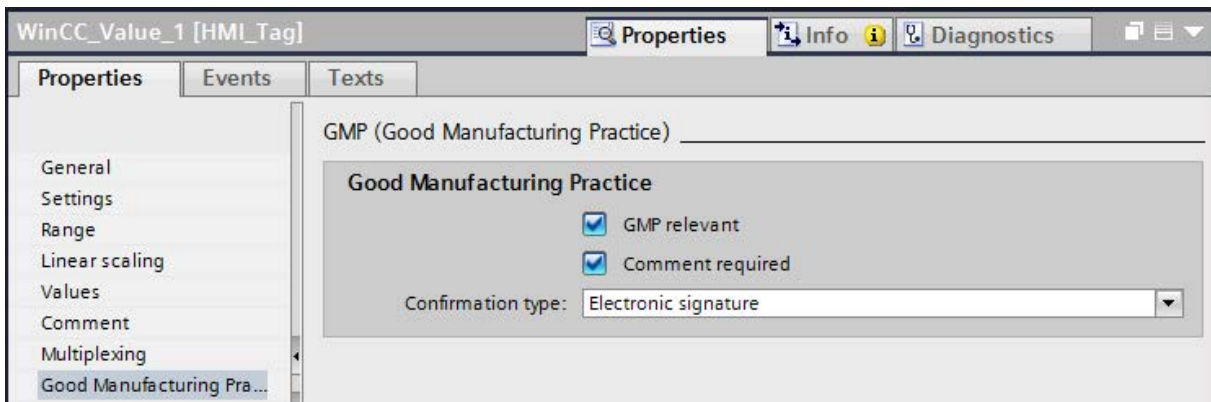

Figure 3: A variable is defined as GMP relevant so that an audit trail entry is created, whenever it is changed by the user.

The audit trail is saved as RDB file (Binary-file). Also it is possible to archive as csv-file or as a Unicode capable txt-file, but these file formats do not support writing data in transactions and hence there is a possibility of data loss during abrupt power failures. An integrated algorithm automatically forms a checksum for each record and enables the user to detect manual changes of the records.

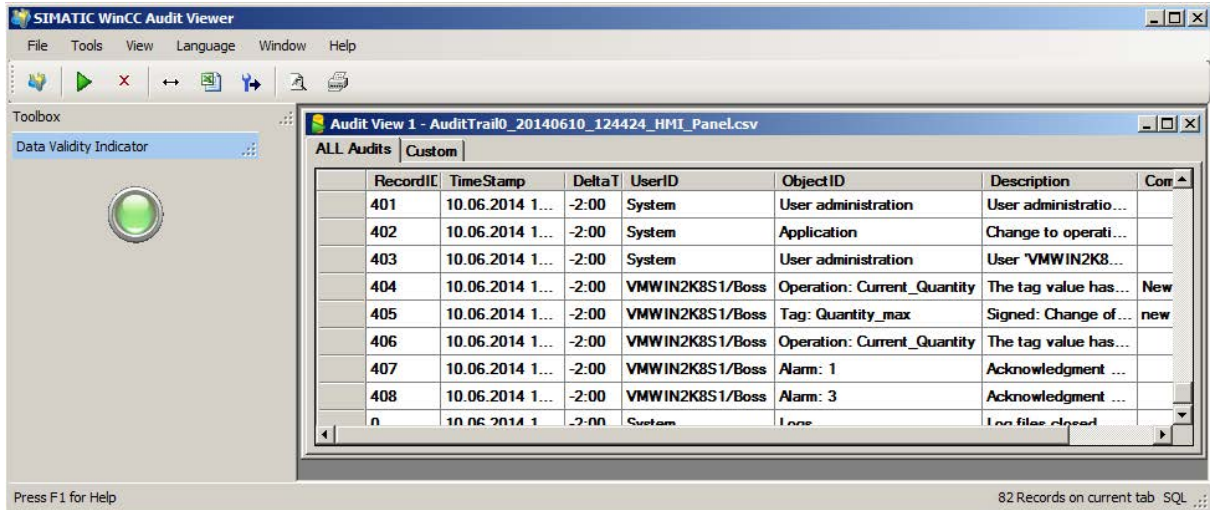

Figure 4: The Audit Viewer displays the audit trail file from Comfort Panels and WinCC Runtime Advanced and confirms with the green signal lamp that the audit trail has not been manipulated.

Configuration control

SIMATIC WinCC (TIA Portal) provides some system functionalities, options, and add-ons to support the control of system configuration. This includes versioning of software elements and projects as well as backup/restore to support the corresponding procedures. For more details see "GMP Engineering Manual SIMATIC WinCC (TIA Portal)" from the VSS Pharma.

2.5 System Access, Identification Codes and Passwords

Users must be assigned the required access rights only, to prevent unauthorized access to the file system, the directory structures, and the system data and their unintended manipulation.

The requirements regarding access security are fully met in combination with procedural controls, such as those for "specifying the responsibility and access permission of the system users".

Additional security mechanisms need to be set up for any "open paths" which might exist. For more information on the basic policies of the security concept and configuration recommendations, refer to the "Security Concept PCS 7 and WinCC" manual.

The user management configuration is performed centrally on an engineering system for each application. After checking of the correct login data, the corresponding user group information which determined the user access rights is transferred to the respective HMI devices.

SIMATIC WinCC (TIA Portal) supports the protection of electronic records by providing:

- Use of a unique user identification (user ID) in combination with a password
- Definition of access rights for user groups
- Password settings and password aging: The user is forced to change his/her password on expiration of a configurable time; the password can be reused only after "n" generations.
- Prompt the user to define a new password at initial logon (initial password).
- The user is automatically blocked after a configurable number of failed logon attempts and can only be unblocked by the administrator.
- Automatic logoff (auto-logout) after a configurable idle time of the keyboard and mouse
- Log functions for actions related to access security, such as logon, manual and automatic logoff, failed login attempts, user blocked after several attempts to enter an incorrect password, and password change by user

Centralized user management

We recommend implementing a centralized user management based on Microsoft Windows and SIMATIC Logon, if applicable even in a domain structure.

- Individual users and their assignment to Windows user groups are defined in the User Access Control of MS Windows.
- SIMATIC Logon provides the link between the Windows user groups and the user groups of the WinCC Runtime system.
- Based on user groups, user rights with different levels are defined in the user administration for the particular HMI device or WinCC Runtime System.
- If the network connection is failed, the central user management is taken over by the local user management. Thereby a predefined local emergency user can be used for predefined emergency operation. SIMATIC Logon users (central users), which are already logged on, are still active until logoff.

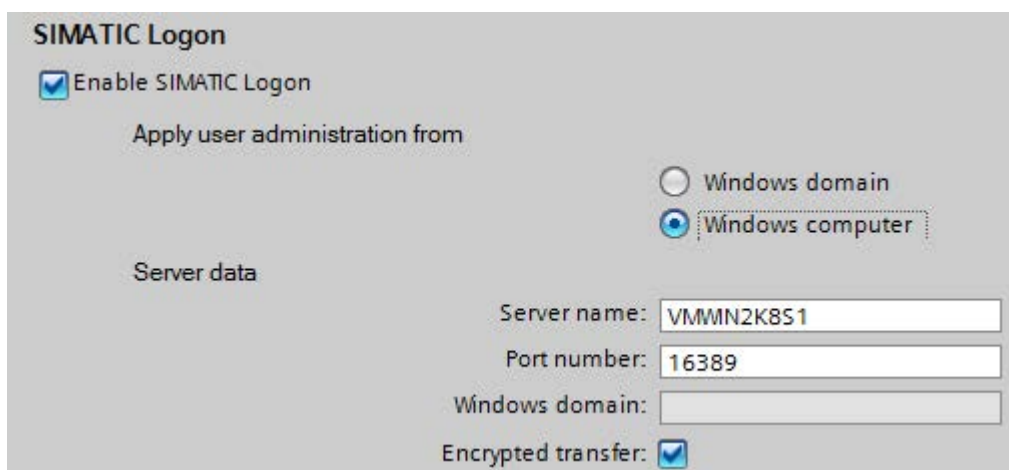

Figure 5: Enable user management based on Microsoft Windows and SIMATIC Logon

User management on local HMI devices

Local HMI panels are installed quite often without any connection to a network. Therefore, in SIMATIC WinCC (TIA Portal) local user management can be implemented on these HMI devices, individual users and their assignment to user groups are then only known locally.

- Individual users and their assignment to user groups are defined in the WinCC configuration.
- Based on user groups, user rights with different levels are defined in the user administration for the particular HMI device or WinCC Runtime Advanced System.

The screenshot shows the SIMATIC WinCC (TIA Portal) interface for user management. The project tree on the left shows the hierarchy: Pharma_Demo > PC_RT [SIMATIC PC station] > HMI_RT_1 [WinCC RT Advanced] > User administration. The main window displays the 'User administration' configuration for the HMI device.

Groups Table:

Figure 6: Assignment of user rights to user groups

2.6 Electronic Signature

SIMATIC WinCC (TIA Portal) provides functions for configuring an electronic signature. The electronic signature is executed in a dialog. Which variables may require an electronic signature upon changes is specified during the configuration phase. The user can sign electronically by confirming the intended action with entering his password. In this way the electronic signature is saved in the audit trail along with the user name, time stamp, and the action performed.

On the SIMATIC Comfort Panels and with WinCC Runtime Advanced a separate signature dialog is available with the option "SIMATIC WinCC Audit for SIMATIC Panels" or "SIMATIC WinCC Audit for Runtime Advanced". The comment can be configured as optional or mandatory for each object.

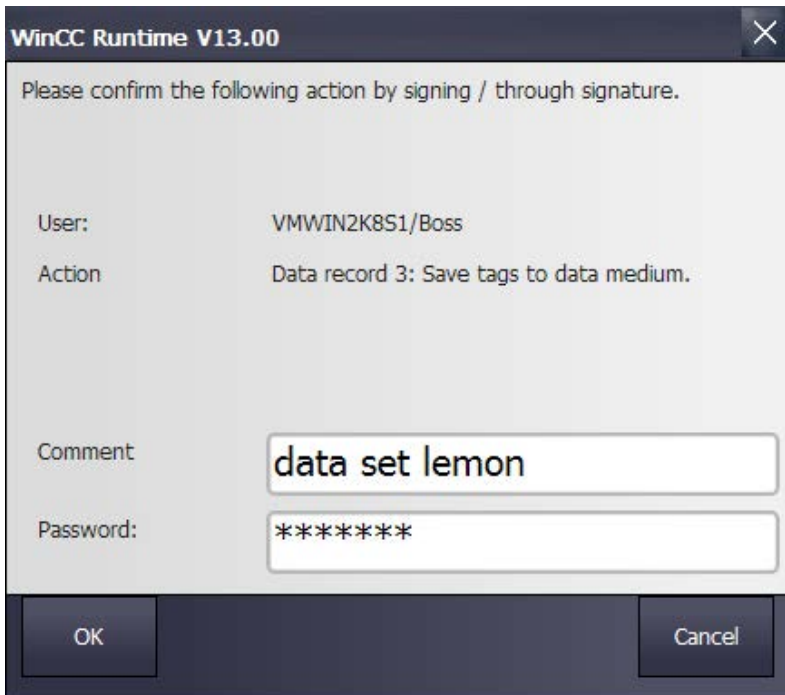

Figure 7: Electronic signature for modification of a tag value on a Comfort Panel or in WinCC Runtime Advanced, including a mandatory comment

3 Evaluation List for SIMATIC WinCC (TIA Portal)

The following list of requirements includes all regulatory requirements from 21 CFR Part 11 as well as from Annex 11. All requirements are structured in the same topics introduced in part 1 of this Compliance Response.

The enlisted *requirements* fully consider both regulations, regardless if technological or procedural controls or a combination of both are needed to fully comply with Part 11 and Annex 11.

The *answers* include – if applicable – how the requirement is handled during the development of the product and which measures should be implemented during configuration and operation of the system. Furthermore the answers include references to the product documentation for technological topics and to the GAMP 5 guide for procedural controls that are already considered in the guide.

3.1 Life Cycle and Validation of Computerized Systems

The fundamental requirement that a computerized system, used as a part of GMP related activities, must be validated is extended by a number of newer Annex 11 requirements detailing expectations on a system's life cycle.

	Requirement	Reference	Answer
3.1.1	Risk management should be applied throughout the lifecycle of the computerized system.	Annex 11, 1	The R&D process for Siemens software products incorporates risk management accordingly. During the validation of a customer-specific application risk management should be ensured by the regulated user.
3.1.2	Validation of a system ensures the accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.	21 CFR 11.10 (a)	Yes, the development of the software product (COTS, see Annex 11, glossary) is under the control of the Siemens QMS and the Product Lifecycle Management process. The regulated user should take appropriate measures to validate the application (see Annex 11, glossary), as well as maintaining its validated state.
3.1.3	Validation documentation covers relevant steps of the life cycle.	Annex 11, 4.1	Yes, the R&D process for the software product covers all relevant steps of the Software Development Life Cycle (SDLC). The responsibility for the validation of the application (see Annex 11, glossary) is with the regulated user.
3.1.4	A process for the validation of bespoke or customized systems should be in place.	Annex 11, 4.6	The validation process for customer-specific applications is under the responsibility of the customer. Nonetheless Siemens is able to support the customer regarding validation activities.

	Requirement	Reference	Answer
3.1.5	Change management and deviation management are applied during the validation process.	Annex 11, 4.2	Yes, the R&D process for the software product includes change management, deviation management and fault corrections. The regulated user should ensure appropriate change management and deviation management (see GAMP 5, appendices M8, D5).
3.1.6	An up-to-date inventory of all relevant systems and their GMP functionality is available. For critical systems an up to date system description [...] should be available.	Annex 11, 4.3	The regulated user should establish appropriate reporting, a system inventory as well as system descriptions (see GAMP 5, appendix D6).
3.1.7	User Requirements Specifications should describe required functions, be risk-based and be traceable throughout the life-cycle.	Annex 11, 4.4	Product Requirement Specifications are used during the R&D process. The regulated user should have the User Requirement Specification appropriately considered in the system's life cycle (see GAMP 5, appendix D1).
3.1.8	Evidence of appropriate test methods and test scenarios should be demonstrated.	Annex 11, 4.7	Ensuring the suitability of test methods and scenarios is an integral part of the SIMATIC product's R&D process and test planning. The regulated user should be involved to agree upon the testing practice (see GAMP 5, appendix D5) for the application.
3.1.9	Appropriate controls should be used over system documentation. Such controls include the distribution of, access to, and use of system operation and maintenance documentation.	21 CFR 11.10 (k)	During the development of the product the product's documentation is treated as being part of the product. Thus the documentation itself is under the control of the development process. The regulated user should establish appropriate procedural controls during development and operation of the system (see GAMP 5, appendices M9 and D6).
3.1.10	A formal change control procedure for system documentation maintains a time sequenced record of changes.	21 CFR 11.10 (k) Annex 11. 10	During the development of the product changes are handled according to the development process. The regulated user should establish appropriate procedural controls during development and operation of the system (see GAMP 5, appendices M8 and O6).
3.1.11	Persons, who develop, maintain, or use electronic record/ electronic signature systems should have the education, training and experience to perform their assigned task.	21 CFR 11.10 (i)	Siemens' processes do ensure that employees have according training for their tasks and that such training is properly documented. Furthermore SIEMENS offers a variety of courses for users, administrators and support staff.
3.1.12	Computerized systems should be periodically evaluated to confirm that they remain in a valid state and are compliant with GMP.	Annex 11, 11	The regulated user should establish appropriate procedural controls (see GAMP 5, appendices O3 and O8).

	Requirement	Reference	Answer
3.1.13	All incidents should be reported and assessed.	Annex 11, 13	SIMATIC offers functionalities to support reporting on different system levels. The regulated user should establish appropriate procedural controls (see GAMP 5, appendix O5).
3.1.14	For the availability of computerized systems supporting critical processes, provisions should be made to ensure continuity of support for those processes in the event of a system breakdown.	Annex 11, 16	The regulated user should appropriately consider the system in his business continuity planning (see GAMP 5, appendix O10).

3.2 Suppliers and Service Providers

If the regulated user is partnering with third parties for planning, development, validation, operation and maintenance of a computerized system, then the competence and reliability of this partner should be considered utilizing a risk-based approach.

	Requirement	Reference	Answer
3.2.1	When third parties are used, formal agreements must exist between the manufacturer and any third parties.	Annex 11, 3.1	The regulated user is responsible to establish formal agreements with suppliers and 3 rd parties.
3.2.2	The competency and reliability of a supplier are key factors when selecting a product or service provider. The need for an audit should be based on a risk assessment.	Annex 11, 3.2 Annex 11, 4.5	The regulated user should assess its suppliers accordingly (see GAMP 5, appendix M2).
3.2.3	The regulated user should ensure that the system has been developed in accordance with an appropriate Quality Management System.	Annex 11, 4.5	The development of SIMATIC products follows the R&D process stipulated in Siemens' Quality Management System.
3.2.4	Documentation supplied with commercial off-the-shelf products should be reviewed by regulated users to check that user requirements are fulfilled.	Annex 11, 3.3	The regulated user is responsible for the performance of such checks and design reviews.
3.2.5	Quality system and audit information relating to suppliers or developers of software and implemented systems should be made available to inspectors on request.	Annex 11, 3.4	Matter and extent of the documentation affected by this requirement should be agreed upon by the regulated user and Siemens. The joint non-disclosure agreement should reflect this requirement accordingly.

3.3 Data Integrity

The main goal of both regulations is to define criteria, under which electronic records and electronic signatures are as reliable and trustworthy as paper records. This requires a high degree of data integrity throughout the whole data retention period, including archiving and retrieval of relevant data.

	Requirement	Reference	Answer
3.3.1	The system should provide the ability to discern invalid or altered records.	21 CFR Part 11.10 (a)	Feasible via the following functions: time stamping, revisions, versioning for configuration and documents, and audit trail for operational entries.
3.3.2	For records supporting batch release it should be possible to generate printouts indicating if any of the data has changed since the original entry.	Annex 11, 8.2	Operational modification of data is recorded in the general audit trail and can be printed out in a report with internal or add-on functionality.
3.3.3	The system should provide the ability to generate accurate and complete copies of electronic records in both human readable and electronic form.	21 CFR 11.10 (b) Annex 11, 8.1	Yes. Accurate and complete copies can be generated in electronic portable document formats or on paper.
3.3.4	Computerized systems exchanging data electronically with other systems should include appropriate built-in checks for the correct and secure entry and processing of data.	Annex 11, 5	Yes. Depending on the type of data, such built-in checks include data type check, access authorizations, checksums, etc. and finally the validation process including interface testing.
3.3.5	For critical data entered manually, there should be an additional check on the accuracy of the data.	Annex 11, 6	The system has built-in plausibility checks for data entry. In addition, an operator dialog can be realized as an additional check.
3.3.6	Data should be secured by both physical and electronic means against damage.	Annex 11, 7.1	In addition to the system's access security mechanisms, the regulated user should establish appropriate security means like physical access control, backup strategy, limited user access authorizations, regular checks on data readability, etc. Furthermore the data retention period should be determined by the regulated user and appropriately considered in the users processes (see GAMP 5, appendices O3, O4, O8, O9, O11, O13)"
3.3.7	Regular back-ups of all relevant data should be done.	Annex 11, 7.2	The regulated user should establish appropriate processes for backup and restore (see GAMP 5, appendix O9).
3.3.8	Electronic records must be readily retrievable throughout the records retention period.	21 CFR 11.10 (c) Annex 11, 17	Yes. As stated above, procedural controls for Backup/Restore and Archiving/Retrieval should be established.
3.3.9	If the sequence of system steps or events is important, then appropriate operational system checks should be enforced.	21 CFR 11.10 (f)	Yes, e.g. allowances can be made for a specific sequence of operator actions by configuring the application accordingly.

3.4 Audit Trail, Change Control Support

During operation regulations require to record operator actions that may result in the generation of new records or the alteration or deletion of existing records.

	Requirement	Reference	Answer
3.4.1	The system should create a record of all GMP-relevant changes and deletions (a system generated "audit trail"). For change or deletion of GMP-relevant data the reason should be documented.	21 CFR 11.10 (e) Annex 11, 9	Yes. Changes during operation can be traced back by the system itself via audit trail and contain information with time stamp, user ID, old and new value, and comment. The audit trail is secure within the system and cannot be changed by a user. It can be made available and also be exported in electronic portable document formats.
3.4.2	Management systems for data and documents should be designed to record the identity of operators entering, changing, confirming or deleting data including date and time.	Annex 11, 12.4	As far as data in the SIMATIC WinCC HMI device is concerned, the requested information is part of the revision information, version information, as well as audit trails.
3.4.3	Changes to electronic records shall not obscure previously recorded information.	21 CFR 11.10 (e)	Yes. Recorded information is not overwritten and is always available in the database.
3.4.4	The audit trail shall be retained for a period at least as long as that required for the subject electronic records.	21 CFR 11.10 (e) Annex 11, 9	Yes, this is technically feasible and must be considered in the application specific backup and restore process (cp. GAMP 5, appendices O9 and O13).
3.4.5	The audit trail should be available for review and copying by regulatory agencies.	21 CFR 11.10 (e)	Yes, see also requirement 3.4.1.

3.5 System Access, Identification Codes and Passwords

Since access to a system must be restricted to authorized individuals and the uniqueness of electronic signatures too depends on the authenticity of user credentials, user access management is a vital set of requirements regarding the acceptance of electronic records and electronic signatures.

	Requirement	Reference	Answer
3.5.1	System access should be limited to authorized individuals.	21 CFR 11.10 (d) 21 CFR 11.10 (g) Annex 11, 12.1	Yes, system access via SIMATIC Logon is based on the operating system's user administration, and user rights are to be defined in the system. Nonetheless also procedural controls should be established by the regulated user, as described in GAMP 5, appendix O11.
3.5.2	The extent of security controls depends on the criticality of the computerized system.	Annex 11, 12.2	System security is a key factor during design and development of SIMATIC products. Nonetheless, since system security highly depends on the operating environment of each IT-system, these aspects should be considered in security management (see GAMP 5, appendix O11). Recommendations and support is given by Siemens' Industrial Security approach.
3.5.3	Creation, change, and cancellation of access authorizations should be recorded.	Annex 11, 12.3	Changes in the user access management are being recorded and should be subject to Change Control procedure.
3.5.4	If it is a requirement of the system that input data or instructions can only come from certain input devices (e.g. terminals), does the system check the validity of the source of any data or instructions received? (Note: This applies where data or instructions can come from more than one device, and therefore the system must verify the integrity of its source, such as a network of weigh scales, or remote, radio controlled terminals).	21 CFR 11.10 (h)	Yes. The WinCC HMI devices can be configured so that special input data / commands can only be performed from a dedicated device, or from a group of dedicated devices. All other devices then have read only access rights at the most.
3.5.5	Controls should be in place to maintain the uniqueness of each combined identification code and password, so that no individual can have the same combination of identification code and password as any other.	21 CFR 11.300 (a)	Yes. The uniqueness of the user ID is ensured either by the MS Windows security system (with SIMATIC Logon) or by local user management of the WinCC HMI device. It is not possible to define more than one user with the same user ID within a workgroup / domain.
3.5.6	Procedures are in place to ensure that the validity of identification codes is periodically checked.	21 CFR 11.300 (b)	The regulated user should establish appropriate procedural controls (see Good Practice and Compliance for Electronic Records and Signatures, Part 2).

	Requirement	Reference	Answer
3.5.7	Password should periodically expire and require to be revised.	21 CFR 11.300 (b)	Yes. Password aging can be configured in the user administration.
3.5.8	A procedure should be established for recalling identification codes and passwords if a person leaves or is transferred.	21 CFR 11.300 (b)	The regulated user should establish appropriate procedural controls (see Good Practice and Compliance for Electronic Records and Signatures, Part 2). When using central user management, a user account can be deactivated in Microsoft Windows security system. For local user management, instead of deactivating a user he might be assigned to a user group without active authorizations.
3.5.9	Following loss management procedures to electronically deauthorize lost, stolen, missing, or otherwise potentially compromised tokens, cards, and other devices that bear or generate identification code or password information, and to issue temporary or permanent replacements using suitable, rigorous controls.	21 CFR 11.300 (c)	The regulated user should establish appropriate procedural controls (see Good Practice and Compliance for Electronic Records and Signatures, Part 2).
3.5.10	Measure for detecting attempts of unauthorized use and for informing security and management should be in place.	21 CFR 11.300 (d)	Yes, unsuccessful attempts to use the system or to perform electronic signatures are recognized and can be logged. The regulated user should establish appropriate procedural controls to ensure a periodic review of security and access control information logs (see GAMP 5, appendix O8).
3.5.11	Initial and periodic testing of devices, such as tokens and cards, that bear or generate identification code or password information to ensure that they function properly and have not been altered in an unauthorized manner.	21 CFR 11.300 (e)	Such devices are not part of SIMATIC HMI portfolio, but might be integrated in the system via SIMATIC Logon. The regulated user should establish appropriate procedural controls (see Good Practice and Compliance for Electronic Records and Signatures, Part 2).

3.6 Electronic Signature

To ensure that electronic signatures are accepted as generally equivalent to handwritten signatures executed on paper, requirements are not only limited to the act of electronically signing records. They also include requirements on record keeping as well as on the manifestation of the electronic signature.

	Requirement	Reference	Answer
3.6.1	Written policies should be established, that hold individuals accountable and responsible for actions initiated under their electronic signatures, in order to deter record and signature falsification.	21 CFR 11.10 (j) Annex 11, 14.a	The regulated user should establish appropriate procedural controls.
3.6.2	Signed electronic records should contain the following related Information: - The printed name of the signer - The date and time of signing - The meaning of the signing (such as approval, review, responsibility)	21 CFR 11.50 Annex 11, 14.c	Yes.
3.6.3	The above listed information is shown on displayed and printed copies of the electronic record.	21 CFR 11.50	Yes.
3.6.4	Electronic signatures shall be linked to their respective electronic records to ensure that the signatures cannot be excised, copied, or otherwise transferred to falsify an electronic record by ordinary means.	21 CFR 11.70 Annex 11, 14.b	Yes.
3.6.5	Each electronic signature shall be unique to one individual and shall not be reused by, or reassigned to, anyone else.	21 CFR 11.100 (a) 21 CFR 11.200 (a) (2)	Yes, the electronic signature uses the unique identifiers for user accounts. The re-use or re-assignment of electronic signatures is effectively prevented.
3.6.6	When a system is used for recording certification and batch release, the system should allow only Qualified Persons to certify the release of the batches and it should clearly identify and record the person releasing or certifying the batch.	Annex 11, 15	Electronic signatures are linked to an individual. The system allows strict determinations about which role and/or individual is allowed to perform a signature.
3.6.7	The identity of an individual should be verified before electronic signature components are allocated.	21 CFR 11.100 (b)	The regulated user should establish appropriate procedural controls for the verification of an individual's identity before allocating a user account and/or electronic signatures.

	Requirement	Reference	Answer
3.6.8	When an individual executes one or more signings not performed during a single session, each signing shall be executed using all of the electronic signature components.	21 CFR 11.200 (a) (1) (ii)	Yes, performing an electronic signature requires the user-ID as well as the user's password.
3.6.9	When an individual executes a series of signings during a single session, the first signing shall be executed using all electronic signature components; subsequent signings shall be executed using at least one private electronic signature component.	21 CFR 11.200 (a) (1) (i)	Yes. Each signature consists of two components (user ID and password).
3.6.10	The use of an individual's electronic signature by anyone other than the genuine owner would require the collaboration of two or more individuals.	21 CFR 11.200 (a) (3)	Yes. It is not possible to falsify an electronic signature during signing or after recording of the signature. In addition, the customer needs procedures that prevent the disclosure of passwords.
3.6.11	Electronic signatures based upon biometrics shall be designed to ensure that they cannot be used by anyone other than their genuine owner.	21 CFR 11.200 (b)	Standard tools of third-party manufacturers can be used to create biometric electronic signatures. The integrity of such solutions should be assessed separately.

3.7 Open Systems

The operation of an open system may require additional controls to ensure data integrity as well as the possible confidentiality of electronic records.

	Requirement	Reference	Answer
7.2.1	To ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records additional measures such as data encryption are used.	21 CFR 11.30	Additional security measures should be taken for open systems; support is provided, for example, based on the configuration information in the "Security Concept PCS 7 and WinCC" manual, or by commonly available standard tools for encryption.
7.2.2	To ensure the authenticity and integrity of electronic signatures, additional measures such as the use of digital signature standards are used.	21 CFR 11.30	SIMATIC WinCC (TIA Portal) does not provide functionality for digital (encrypted) signatures.
